glucosyltransferase in a mammal. The immune response results in reduction of the colonisation or accumulation of mutans streptococcal strains in the mammal. Compositions containing AAW34156 specifically interfere with the glucan-binding activity of the streptococcal glucosyltransferase. The peptides can also be used in vaccines for
                                                                                                                                                                                                           AAW34156-W34160 represent immunogenic fragments of the Streptomyces mutans glucosyltransferase (GTF) enzyme. AAW34157 and AAW34158 are from the catalytic domain of GTF, while AAW34160 is from the GTF surface domain. AAW34156 and AAW34159 are from the glucan-binding domain of GTF. These sequences can all be used in the immunogenic composition of the invention. The composition of the invention can alternatively comprise one or more of these sequences linked to a lysine core matrix (see AAW34161-W34165). A composition comprising one of these sequences can be administered to a mammal to refere a formal control of these sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Glucosyltransferase; GTF; enzyme; immunogen; catalytic domain; vaccine; surface domain; glucan-binding domain; mutans streptococcal strain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim

                                                             compositions, are used to induce an antibody response to cariogenic bacteria, collectively called "mutans streptococci" (i.e. any of Streptococcus mutans, S. rattus, S. cricetus or S. sobrinus), especially to prevent colonisation, to reduce numbers of bacteria or to reduce incidence of caries, in humans or other animals. The composition can therefore be used for the treatment or prevention of caries (particularly dental caries). Abs raised against (A) can be used: (a) to detect SG, and (b) for passive immunisation, e.g. applied directly to the surface of teeth. SG is a poorly immunogenic type 2 T-cell independent antigen but when coupled to (I) it produces a conjugate which induces significant immunity to both components, resulting in immunological memory and
                                                                                                                                                                                                                                                                                                                                                 This sequence represents a glucosyltransferase (GTF) immunogenic epitope and can be used in the immunogenic composition of the invention. The immunogenic composition of the invention of the invention of the invention of the invention. The immunogenic composition (A) comprises at least one streptococcal glucan (SG) and at least one component (I) covalently coupled, (in)directly, to SG. (A) elicits antibodies (Ab) to both SG and (I). (A) and related the invention of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Immunogenic compositions for control of dental caries, based on Streptococcus mutans components, particularly for vaccination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GTF; antigenic epitope; glucosyltransferase; immunogenic epitop immunogenic composition; streptococcal glucan; antibody respons cariogenic bacteria; mutans streptococci; colonisation; caries;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GTF antigenic epitope

                                   glucosyltransferase-I (and mutants). The DNA was obtd. by treating S. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with Sau3AI and fractionating on agarose gel. The 3-5 kbp fragment was ligated into pUC18 and E. coli yM109 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for

                                                                                                                                                                                                                                    Streptococcus salivarius. The enzyme is primer-independent, and produces soluble glucan from sucrose. A gene encoding the enzyme may be cloned and expressed in Escherichia coli using a subclone of phage lambda-Cl3, e.g. plasmid pGSG501 or plasmid pGSG502. The DNA may also be expressed in a transgenic plant, to improve the level of stored carbohydrate in a pasture plant which normally contains low levels, or to prevent degradation of stored carbohydrate during plant senescence. Dextran may be isolated from the plant, for use as a food binder or pharmaceutical additive. Primer independence ensures that the enzyme will be functional in plants. The glucan is poorly degraded in plants but easily degraded by bacteria in the rumer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (GIFF/)
                                                                   1469
                                                                                                                                                                                                                                                                                                                                                                                          The sequence represents an alpha-D-glucosyltransferase from Streptococcus salivarius. The enzyme is primer-independent, and

                                                                                                                                                                                                                                                                                                                               glucosyltransferase group) The recombinant, purified alternan sucrase gene is useful for the fermentative production of alternan (a carbohydrate) and/or fructose by secreting the enzyme into a saccharose-containing culture medium. Alternatively, the enzyme is contacted with a saccharose-containing solution. The alternan and/or fructose is then isolated from the medium. Cosmetic products or foodstuffs containing alternan can be produced. Recombinant production alternan sucrase is advantageous as it provides a cost effective means producing fructose for high fructose containing syrups, production of which previously has been achieved by costly production from maize starch. This sequence represents the Leuconostoc mesenteroides alternan
                                                                                                                                                                                                                                                                                                                       starch. This sequence represents the Leuconostoc mesenteroides alternan sucrase protein which is described in the method of the invention.

This sequence is encoded by nucleotides 7159-8118 of the Toxin A gene. The invention relates to fragments of toxin A of CD which are non-toxic and immunogenic. They can be used in the preparation of vaccines against to infection. The amino acid molecules and antibodies against them can be used in the preparation of an agent for the prophylaxis or treatment of a CD infection. They can also be used for detection and diagnosis of CD infection.

                                                                               A protein (AAR95017) comprising amino acids 1873-2684 of Clostridium difficile VPI strain 10463 toxin A (see also AAR95016) was obtd. by PCR amplification of genomic DNA. The PCR product can be expressed in transformed E. coli host cells as a soluble fusion protein, with maltose binding protein or a polyhistidine affinity tag as fusion partner. The resulting soluble fusion proteins, which are substantially endotoxin-free, can be used in anti-clostridial antitoxin therapy for humans and animals.
                                                                                                                                                                                                                                                                                                                                                                          24-OCT-1994;

                                                                                                                                                                                                                                             This sequence represents an immunogenic fragment of Clostridium difficile (CD) Toxin A, designated fragment p9/10. This sequence is encoded by nucleotides 530-8115 of the Toxin A gene. The invention relates to fragments of toxin A of CD which are non-toxic and immunogenic. They can be used in the preparation of vaccines against to infection. The amino acid molecules and antibodies against them can be used in the preparation of an agent for the prophylaxis or treatment of a CD infection. They can also be used for detection and diagnosis of CD infection.
                                                                                                                                                                                                                                                                                                                                                                 New isolated Clostridium difficile proteins - comprise fractoxin A, used to develop agents for prophylaxis, treatment diagnosis of C. difficile infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                     (UNLO )

                                                                                                                                                                                                                                                                                                                    The present sequence represents a Clostridium difficile recombinant protein comprising toxin A repeating units (rARU). The protein is used to prepare recombinant protein components. These recombinant protein components comprise at least one repeating unit of Clostridium difficile toxin A (rARU), one repeating unit of Clostridium difficile toxin B (rBRU), or both. The recombinant protein is used as a vaccines, and is useful for conferring a protective response in a mammalian host. It is also useful for producing antibodies for passive immune therapy against a strain of Clostridium difficile. The vaccines, formulated for use in humans and animals, is useful for treating Clostridium difficile
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Toxin A passive
 Toxin A; repeating unit; rARU;
                        A recombinant protein of toxin A repeating units (rARU)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogenic composition for use as a vaccine against Clostridium difficile, comprises recombinant protein component consisting of at least one repeating unit of toxin A or toxin B or both, of Clostridium difficile
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Wilkins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Misc-difference

                                                                                                                                                                                                                                                                                                                                                                                 nosocomial pathogenic microorganism. The immunogenic compositions are useful as vaccines for humans, particularly children and animals in affording protection against one or more microbial pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                             synthesized. The immunogenic compositions are useful for eliciting a protective immune response (T-cell dependent or T-cell independent, a cellular or humoral immune response) to a strain of pathogenic microorganism. The immunogenic composition also elicits a protective immune response against the polysaccharide produced by a strain of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     component, in which the recombinant protein is encoded by a gene from a strain of Clostridium difficile and the polysaccharide component is isolated from a strain of pathogenic microorganism or is chemically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    protein comprising toxin A repeating units (rARU). The protein is used to prepare immunogenic compositions of the invention. The immunogenic compositions comprise a recombinant protein and a polysaccharide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 1; Fig 3; 45pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunogenic compositions useful as vaccines comprise a recomprotein of toxin A or B of Clostridium difficile conjugated polysaccharide of a microbial pathogen .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Wilkins

                                                                                                                                                                                                                                             Clostridium difficile VPI strain 10463 toxin A (AAR95016), the product of the toxin A gene (AAR79248), is a potent cytotoxin that plays a direct role in damaging gastrointestinal tissues and is associated with diarrheetic disease. It can be obtd. by expression in transformed E. coli hosts of portions of DNA that together cover the entire toxin A gene. Toxin A, and portions of it (see also AAR95014-15 and AAR95017), pref. expressed as fusions to polyhistidine affinity tags or maltose binding protein, are used to raise avian antibodies useful as antitoxins or diagnostics, and in vaccine prodn.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

FUNCTION: PRODUCTION OF EXTRACELLULAR GLUCANS, THAT ARE THOUGHT TO PLAY A KEY ROLE IN THE DEVELOPMENT OF THE DENTAL PLAQUE BECAUSE OF THEIR ABILITY TO ADHERE TO SMOOTH SURFACES AND MEDIATE THE AGGREGATION OF BACTERIAL CELLS AND FOOD DEBRIS.

CATALYTIC ACTIVITY: SUCROSE + (1,6-ALPHA-D-GLUCOSYL)(N) = D-FRUCTOSE + (1,6-ALPHA-D-GLUCOSYL)(N+1).

ENZYME REGULATION: GLUCAN SYNTHESIS BY GTF-S IS INDEPENDENT OF PRIMER GLUCAN UNLIKE GTF-I.
                                                                                                                                                                                                                              1,6-GLUCOSE).

Biochim. Biophys. Acta 1087:259-261(1990).

-i- FUNCTION: MEDIATES THE ENDOCYTOSIS OF PLASMA GLYCOPROTEINS TO WHICH THE TERMINAL SIALIC ACID RESIDUE ON THEIR COMPLEX CARBOHYDRATE MOIETIES HAS BEEN REMOVED. THE RECEPTOR RECOGNIZES TERMINAL GALACTOSE AND N-ACETYLGALACTOSAMINE UNITS. AFTER LIGAND BINDING TO THE RECEPTOR, THE RESULTING COMPLEX IS INTERNALIZED AND TRANSPORTED TO A SORTING ORGANELLE, WHERE RECEPTOR AND LIGAND ARE DISASSOCIATED. THE RECEPTOR THEN RETURNS TO THE CELL MEMBRANE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mus musculus (Mouse).

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                The sequence represents an alpha-D-glucosyltransferase from Streptococcus salivarius. The enzyme is primer-independent, and produces soluble glucan from sucrose. A gene encoding the enzyme may be cloned and expressed in Escherichia coli using a subclone of phage lambda-Cl3, e.g. plasmid pGSG501 or plasmid pGSG502. The DNA may also be expressed in a transgenic plant, to improve the level of stored carbohydrate in a pasture plant which normally contains low levels, or to prevent degradation of stored carbohydra during plant senescence. Dextran may be isolated from the plant, functions as a food binder or pharmaceutical additive. Primer independent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Alpha-D-glucosyltransferase; primer-independent; soluble gl

The DNA was obtd. by treath, s. sobrinus 6715 with mutanolysin, extracting the chromosomal DNA, partially digesting with Sau3AI and fractionating on agarose gel. The 3-5 kbp fragment was ligated into pUC18 and E. coli JM109 transformed with it. A GT-1 expressing clone was isolated and sequenced. The clone may be used in the development of a drug for

                                                                                                                                  carbohydrate) and/or fructose by secreting the enzyme into a saccharose-containing culture medium. Alternatively, the enzyme is contacted with a saccharose-containing solution. The alternan and/or fructose is then isolated from the medium. Cosmetic products or foodstuffs containing alternan can be produced. Recombinant production alternan sucrase is advantageous as it provides a cost effective mean alternan sucrase is advantageous as it provides a cost effective mean
                                                                                                                                                                                                                                                                           This invention describes a novel nucleic acid molecule (I) alternan sucrase (E.C. 2.4.1.140 - an enzyme, that belongs glucosyltransferase group) The recombinant, purified altern gene is useful for the fermentative production of alternan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (PLAN-)
                                                                  producing fructose for high fructose containing syrups, production which previously has been achieved by costly production from maize starch. This sequence represents the Leuconostoc mesenteroides altered the content of the content
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    poorly degraded in plants but easily degraded by bacteria of grazing livestock.

                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the Lawsonia intracellularis flagellar hook protein FlgE. The present invention describes an isolated or recombinant polypeptide (I) that comprises, minics or cross-reacts with a B- or T-cell epitope of a FlgE (flagellar hook) polypeptide from a Lawsonia spp. (I) has antibacterial activity, and induces a specific humoral immune response. (I) are used as antigens in vaccines to prevent correct infection by Lawsonia, in birds and animals, especially pigs, to raise specific antibodies (Ab) and to defect past or present corrimensologically cross-reactive species, ato for identification of cepitopes in FlgE. Vectors that contain nucleic acids (II) encoding (I) are useful in genetic vaccines, and fragments of (II) are useful cas primers or probes for detecting L. intracellularis or related microorganisms, in hybridisation or amplification assays.
